Confinement & Crate Training

Owners are often unsure whether they need to crate-train their puppies or newly adopted dogs or whether to simply confine them in a dog-proofed area during the early weeks or months following adoption.

Crate training helps with the following:

- Housetraining: prompts the dog to hold bladder and bowels when unsupervised to expedite housetraining
- Chew-training: prevents the dog from chewing furniture, walls and anything else except the chew toys he is crated with so good habits automatically form
- Settling down; patterns dog to be inactive when alone
- Owner as good guy: by decimating housetraining and chew-training mistakes; dog partially "self-trains"
- Preparation for possible close confinement; dogs that are used to close confinement are less likely to be stressed when caged during a hospital stay or travel

Chewing and activity management could be accomplished with a well dog-proofed room or an ex-pen and these are alternatives if the dog is solid in his elimination habits. If the dog is shaky on housetraining, however, you're better off crate-training him as the close confinement will inhibit urination and defecation. To get the crating effect, the crate should be only large enough for the dog to stand up, turn around and lie down comfortably in. An ex-pen, dog-proofed room or too-large crate allows the dog to use one end as bathroom area and the other end as bed.

How to Get Him in His Crate

You can't just throw the dog in the crate and expect him to adjust. That would be traumatic. Early association is huge. Make the crate comfy with a nice crate pad or blanket, situate it in a high traffic area like the kitchen and, whenever the dog isn't looking, drop a couple of treats at the back. Don't point these out to him. Let him discover them on his own. Feed him meals in there, always with the door open. Using heavy string, tie an attractive stuffed chewtoy to the rear inside so that the dog must lie in the crate in order to chew on it.

After a few days of this, start teaching the dog to enter and exit on cue. Say "into bed" or "into the crate," throw in a treat, praise as the dog goes in and eats the treat and then let him exit. Repeat this a few times and then change the order of events slightly: instead of throwing the treat into the crate after you say "into bed," wait for him to go in on his own

before dropping in the treat. If the dog doesn't enter on cue, simply wait. Do not cue him a second time and do not crack and throw the treat in. Just wait. If he doesn't go in, end the training session without comment. Try another session in a little while, still withholding the reward until the dog goes in on his own. When he does (and they all do eventually so hang in there), give him a double or triple reward, do a few more rewarded reps and then end the session. Always leave the dog wanting more.

When the dog is going in and out on cue, you are ready to try the first lock-in. Play the in/out of the crate game, only now close the door after he has gone in and feed him treats through the grate for a minute or two before opening the door. Do this several times. Then practice walking around the crate and around the room while he is locked inside, pitching treats at him occasionally and then, after a couple of minutes, opening the door and letting him out. Make the whole thing a positive experience for him.

The next step is to add some real duration. Crate him while you watch a movie. Stuff a couple of chew-toys with something good. Set the crate up right next to your chair and, just before you sit down to enjoy the movie, cue the dog into the crate. When he goes in, give him the chew toys, close the door and start the movie. Leave a few times to get a snack or a drink, but always come back within a minute or so. The first experience being locked in the crate for this length of time must be an overwhelmingly easy and good one. Any noise, agitation or tantrum from the dog should be ignored. At the end of the movie, if the dog is quiet and settled in the crate, simply open the door and let him out. Do not open the door if the dog is misbehaving, as this can potentially reinforce the misbehavior. When you do open the door, behave neutrally. Make the exit an anticlimax. All the good stuff should happen while he's IN the crate, behaving nicely.

Now spend a few days crating the dog with the door closed when you're at home, going about your usual business. Ignore any noise. Provide interesting crate puzzles (i.e., chew toys) each time.

The next step is leaving the house. The first time you do, leave for just a minute, then come back. Then do five minutes, fifteen, thirty, an hour, two, three and four hours. Throw in some short ones (a minute or so) in between to mix it up. Depart and arrive without any fanfare. Tire the dog out with vigorous exercise and training before the longest absences. It is important to gradually condition the dog to being in the crate this way before using it in your day to day life. And don't forget the chew toys.

Help! He Soils the Crate

If you discover your dog is soiling his crate, the first thing to try is removing the pad or blanket for a week – the porous material may be triggering elimination. Be sure, also, that you are not stretching the dog too long between bathroom trips and forcing him to eliminate in his crate. Keep both the dog and the crate scrupulously clean. You can often nurse back the clean instinct. It would also be prudent to have him checked by his veterinarian for a bladder infection or sleep incontinence.
